Streamlining IT Procurement

Automating Standard Laptop Orders with Flow Designer

SCENARIO
Requesting and receiving a standard laptop through Service Catalog

	Entice	Enter	Engage	Exit	Extend
	How does someone initially become aware of this process?	What do people experience as they begin the process?	In the core moments in the process, what happens?	What do people typically experience as the process finishes?	What happens after the experience is over?
Steps What does the person (or group) typically experience?	Identify laptop need	Select Standard Laptop	Approval	Hardware configuration	Laptop configured
	Open Service Catalog	Submit request	Flow creates catalog task		Future requests use same flow
Interactions What interactions do they have at each step along the way? **Things:** digital touchpoints or physical objects **Places:** where are they? **People:** who do they see or talk to?	Employee opens ServiceNow Service Catalog	Employee submits the standard laptop request	Approved request triggers Flow Designer	Hardware team performs laptop configuration	Configuration task is completed and laptop is ready
	Employee selects the Standard Laptop catalog item	Request moves through the required approval	Flow Designer creates a Catalog Task and assigns it to Hardware		The automated workflow can be reused for standard laptop requests
Goals & motivations At each step, what is a person's primary goal or motivation?	Help me start a standard laptop request	Help me submit the request correctly	Help me avoid manual configuration-task handling	Help me get the laptop configured	Help me receive a configured standard laptop
	Help me choose the correct standard laptop option	Help me get the request approved	Help me ensure the task reaches the Hardware team		Help me have a consistent process for future requests
Positive moments What steps are enjoyable, productive, motivating, or delightful?	Clear starting point for the request	Request details are captured	Automation creates the configuration task	Configuration work is initiated	Laptop is ready after configuration
	Standard laptop option is easy to identify	Approval provides a clear control point	Hardware assignment is explicit		Repeatable workflow for standard requests
Negative moments What steps are frustrating, confusing, costly, or time-consuming?	Uncertainty about where to start	Manual steps can cause errors or omissions	Manual intervention may be needed if automation is absent	Configuration can take longer when not triggered promptly	Longer waiting time if configuration is delayed
	Possible confusion if the catalog item is not clear	Waiting for approval can delay progress	Configuration task could be overlooked or delayed		Inconsistent handling can return if the process is not standardized
Areas of opportunity How might we make each step better? What ideas do we have?	Make the Standard Laptop catalog item easy to find	Trigger the defined approval workflow consistently	Automatically create the Catalog Task	Populate task details from the Requested Item	Track completion of the configuration task
	Keep the request form focused on required information	Use Flow Designer after approval	Set Assignment Group to Hardware		Reuse the same automated flow for standard laptop orders
