

Streamlining IT Procurement

Automating Standard Laptop Orders with Flow Designer

Project Design Phase-II – Completed Artifacts

Field	Value
Project Name	Streamlining IT Procurement: Automating Standard Laptop Orders with Flow Designer
Primary Platform	ServiceNow
Automation	Flow Designer
Primary Service	Standard Laptop
Primary Assignment Group	Hardware
Approval State	Approved

1. Project Overview

The current IT procurement process for standard laptops involves manual configuration and task handling, which can cause delays, oversight, and additional manual effort. The proposed solution uses ServiceNow Flow Designer to automatically create a Catalog Task after the Standard Laptop request is approved, populate the task details, and assign it to the Hardware group.

9. End-to-End Automated Flow

Step	Process	Expected Result
1	Open ServiceNow and Flow Designer.	Flow Designer is available.
2	Create a new Flow named “Standard laptop task”.	Flow is created in Global application with System user execution.
3	Add Service Catalog trigger.	Flow listens for the relevant catalog process.
4	Add Create Catalog Task action.	Catalog Task creation is configured.

5	Map Requested Item Record.	Request item is connected to the task.
6	Set short description and description.	Both contain “Laptop need to Configured”.
7	Set Assignment group to Hardware.	Hardware team receives ownership.
8	Set Approval to Approved.	Task creation is tied to approved requests.
9	Save and Activate the flow.	Automation becomes active.
10	Associate the flow with Standard Laptop through Maintain Items / Process Engine.	Standard Laptop uses the new flow.
11	Order Standard Laptop from Service Catalog.	Request is submitted.
12	Approve the request and inspect Requested Item → Catalog Tasks.	Generated task shows status, description and Hardware assignment.
