

Functional Specification Document (FSD) Canvas

Streaming IT procurement: Automating standard laptop orders with flow designer / Tableau / Artificial Intelligence / Machine Learning
/ GenAI Functional & Performance Testing / Salesforce / Power BI / User Acceptance Testing

Prepared from the uploaded project and testing templates. Where the source material does not define a requirement, the canvas marks it as TBD rather than inventing project-specific details.

Source-aligned structure

The canvas uses the uploaded materials' terminology: project overview/objective, functional scope, performance/model testing, test scenarios and results, bug tracking, and sign-off. The Tableau and Power BI templates emphasize rendered data, preprocessing, filters, calculation/DAX fields, and dashboard/report/story design. The AI/ML templates emphasize model summary, accuracy/metrics, tuning and validation. The GenAI template defines functional cases FT-01–FT-04 and performance cases PT-01–PT-03. The UAT template defines test cases, defect tracking and sign-off.

1.Streamlining IT Procurement: Automating Standard Laptop Orders with Flow Designer

Functional specification canvas derived from the uploaded DHAK project document.

FSD Canvas Element	Project Definition / Requirement
Project purpose	Automate the standard-laptop procurement/configuration workflow using ServiceNow Flow Designer to reduce manual intervention, improve task allocation and reduce user waiting time.
Problem statement	Standard laptop requests can require configuration; the current process has manual overhead and can lead to delays, oversight and inefficient resource allocation.
User story	As an IT procurement team member, I want standard laptop orders to automatically generate and assign configuration tasks to the Hardware team so laptops can be configured promptly after arrival.
In scope	Flow creation; Service Catalog trigger; Create Catalog Task action; assignment to Hardware; approval condition; Standard Laptop catalog-item flow assignment; placing a Standard Laptop order; approval; verification of the resulting catalog task.
Functional requirement – Flow	Create a flow named “Standard laptop task” in the Global application, running as System user, triggered by Service Catalog.
Functional requirement – Catalog task	Create a Catalog Task from the Requested Item Record with short description “Laptop need to Configured”, description “Laptop need to Configured”, Assignment group “Hardware”, and Approval “Approved”.
Functional requirement – Catalog item	Associate the created flow with the Standard Laptop service catalog item and remove remaining automations as specified in the source procedure.
Functional requirement – approval	A Standard Laptop request is placed through Service Catalog, the request is approved, and the Requested Item is checked for the resulting Catalog Task.
Expected outcome	The catalog task is automatically created after approval and is assigned to Hardware for laptop configuration.
Validation / acceptance	Verify flow activation, Standard Laptop flow assignment, approval, catalog-task creation, short description, assignment group and updated task status.
Performance / non-functional requirements	Not specified in the DHAK source. TBD: response time, throughput, failure handling, availability and notification requirements.
Dependencies	ServiceNow, Flow Designer, Service Catalog, Standard Laptop catalog item, Requested Item and Catalog Task records, Hardware assignment group.
Open items	TBD: exact field mappings beyond those specified, exception handling, notifications, SLA targets, security/roles, audit requirements and rollback procedure.

2. Tableau – Dashboard / Story Performance Testing

Canvas derived from the uploaded Tableau performance-test template.

FSD Canvas Element	Project Definition / Requirement
Project purpose	Validate the Tableau solution against the template's model/performance parameters.
Functional scope	Data rendering; data preprocessing; utilization of filters; calculation fields; dashboard design; story design.
Data rendering	Document whether the expected data is rendered correctly. Evidence/screenshot: TBD.
Data preprocessing	Document preprocessing performed before visualization. Details: TBD.
Filters	Document filters used and verify that filtering produces the intended dashboard/story changes. Details: TBD.
Calculation fields	Document calculation fields used in the Tableau solution. Details: TBD.
Dashboard design	Record the number of visualizations/graphs and provide evidence. Exact count: TBD.
Story design	Record the number of visualizations/graphs and provide evidence. Exact count: TBD.
Performance acceptance	Source template does not define numeric response-time or throughput thresholds. TBD.
Test evidence	Use the template's Screenshot / Values column for evidence.
Open items	Project name, team ID, maximum marks, data source, dashboard/story names, visualization count, preprocessing details, filters, calculations and measurable performance criteria are TBD.

3. Artificial Intelligence – Model Performance FSD Canvas

Canvas derived from the uploaded AI model-performance template.

FSD Canvas Element	Project Definition / Requirement
Project purpose	Document and validate AI model performance using model summary, accuracy and fine-tuning results.
Model summary	Provide a concise description of the AI model, task and intended output. Source template leaves this as a value to be filled: TBD.
Training accuracy	Record training accuracy. Value: TBD.
Validation accuracy	Record validation accuracy. Value: TBD.
Fine-tuning	If fine-tuning is performed, record the fine-tuning result and validation accuracy. If not performed, mark Not Applicable.
Functional validation	Verify that the model performs the intended task and produces outputs consistent with the defined project objective. Specific task/output is not provided in the source and is therefore TBD.
Performance validation	Compare recorded training and validation results and document evidence/screenshots.
Acceptance criteria	Model summary, training accuracy, validation accuracy and applicable fine-tuning results are completed with supporting evidence.
Open items	Model type, dataset, target variable/task, baseline, evaluation metric definitions, threshold, test-set performance, inference time and deployment requirements are TBD.

4. Machine Learning – Model Metrics & Tuning FSD Canvas

Canvas derived from the uploaded machine-learning model-performance template.

FSD Canvas Element	Project Definition / Requirement
Project purpose	Measure ML model performance using regression/classification metrics and validate model tuning.
Regression metrics	If regression model: record MAE, MSE, RMSE and R^2 score.
Classification metrics	If classification model: record confusion matrix, accuracy score and classification report.
Model tuning	Record hyperparameter tuning performed.
Validation method	Record the validation method used.
Functional validation	Verify that the selected model produces predictions/classifications for the defined ML task. The specific business task and dataset are not provided: TBD.
Performance validation	Record metric values and evidence; compare against project-defined acceptance thresholds. Thresholds are not specified in the source: TBD.
Acceptance criteria	Applicable metrics are populated; tuning details are documented; validation method is recorded; supporting evidence is attached.
Open items	Model/task, dataset, train-test split, baseline, target thresholds, hyperparameter search space, random seed, test results and deployment performance are TBD.

5. GenAI – Functional & Performance Testing FSD Canvas

Canvas directly aligned to the uploaded functional/performance test scenarios.

FSD Canvas Element	Project Definition / Requirement
Project purpose	Validate GenAI input handling, content generation, API connectivity, response time, concurrent API behavior and file-upload load.
FT-01 – Text input validation	Enter valid and invalid text in input fields. Expected: valid inputs accepted and errors shown for invalid inputs.
FT-02 – Number input validation	Enter numbers within and outside the valid range. Expected: valid values accepted and out-of-range values rejected with an error.
FT-03 – Content generation	Provide complete inputs and click Generate. Expected: correct content is generated based on input.
FT-04 – API connection	Check API key and model response. Expected: API responds successfully.
PT-01 – Response time	Use a timer to check content generation time. Source target: under 3 seconds.
PT-02 – API speed / concurrency	Send multiple API calls at the same time. Expected: API should not slow down.
PT-03 – File upload load	Upload multiple PDFs and check processing. Expected: processing works smoothly without crashing.
Test-result fields	For every test: Actual Result and Pass/Fail must be recorded.
Acceptance criteria	All defined FT/PT scenarios are executed, results are captured, failures are investigated, and evidence is attached.
Open items	Exact concurrent-call volume, PDF size/count, environment, API provider/model, error codes, availability target and performance measurement method beyond the template are TBD.

6. Salesforce – Data Management, Objects, Fields & Reports

Canvas derived from the uploaded Salesforce model-performance template.

FSD Canvas Element	Project Definition / Requirement
Project purpose	Document the Salesforce automation setup for data management using objects, fields and reports.
Data import behavior	When imported records match correctly, records are created; otherwise an error is shown.
Model summary	Salesforce automation setup for data management using Object, Fields and Reports.
Accuracy – training	Template records training accuracy as 98%.
Accuracy – validation	Template records validation accuracy as 98%.
Functional validation	Validate correct record creation for matching imported data and error handling for non-matching data.
Confidence score	The template includes a confidence-score field only for YOLO projects and describes a 92% confidence example. This is not inherently applicable to Salesforce; mark N/A unless the project actually contains a YOLO/object-detection component.
Reports	Validate that configured reports reflect successfully created/managed records. Specific report names and layouts: TBD.
Acceptance criteria	Correctly matched imports create records; incorrect/non-matching imports generate an error; configured objects/fields/reports behave as specified.
Open items	Object names, field mappings, validation rules, import volume, error-message text, report definitions, security profiles/permissions and measurable performance thresholds are TBD.

7. Power BI – Dashboard / Report Performance Testing

Canvas derived from the uploaded Power BI performance-test template.

FSD Canvas Element	Project Definition / Requirement
Project purpose	Validate Power BI data handling, filtering, DAX and dashboard/report design.
Data rendered	Document whether expected data is rendered correctly. Evidence/value: TBD.
Data preprocessing	Document preprocessing applied to source data. Details: TBD.
Data filters	Document utilization of data filters and verify filtering behavior. Details: TBD.
DAX queries	Document DAX queries used and their purpose. Details: TBD.
Dashboard design	Record the number of visualizations/graphs and provide evidence. Exact count: TBD.
Report design	Record the number of visualizations/graphs and provide evidence. Exact count: TBD.
Performance acceptance	The source template does not provide numeric performance thresholds. TBD: refresh duration, visual load time, dataset size, concurrency and gateway performance.
Test evidence	Use the template's Screenshot / Values fields for evidence.
Open items	Dataset, source systems, refresh schedule, DAX definitions, filter list, dashboard/report names, visualization counts and measurable thresholds are TBD.

8. User Acceptance Testing (UAT) – FSD / Acceptance Canvas

Canvas derived from the uploaded UAT template and intended to be used as the acceptance layer for the above solutions.

FSD Canvas Element	Project Definition / Requirement
Project overview	Record project name, project description, version and testing period.
Testing scope	List features/functionality and user stories/requirements to be tested.
Testing environment	Record URL/location and credentials if required. Do not place passwords in the FSD; use an approved secure credential mechanism.
Test case structure	TC ID; Test Scenario; Test Steps; Expected Result; Actual Result; Pass/Fail.
Scenario coverage	Cover both positive and negative scenarios, as required by the source template.
Bug tracking structure	Bug ID; Bug Description; Steps to reproduce; Severity; Status; Additional feedback.
Defect status	Use the template statuses Open, In Progress and Closed; severity values Low, Medium and High.
Feedback	Testers should provide detailed feedback and suggestions for improvement.
Release gate	Obtain sign-off from both the project manager and product owner before proceeding to deployment.
Sign-off	Tester Name, test-completion date and tester signature.
Acceptance criteria	All planned UAT cases executed; actual results recorded; defects documented; required fixes verified; final sign-off completed.
Open items	Project-specific requirements, user stories, test data, environment URL, test dates, named testers, approval owners and deployment decision are TBD.
